"Pseudohypoparathyroidism - A Primary Defect of the Renal Tubule."

Prague, Casopis Lekaru Ceskych, Vol 105, No 34, 26 Aug 66, pp
922 - 924

Abstract [Authors' English summary modified]: Influence of exogenous parathormone on the renal clearance of phosphates and on the urinary excretion of hydroxyproline and citric acid in pseudohypoparathyroidism, post-operative hypoparathyroidism, and in healthy controls was investigated. Direct evidence was found proving that the primary defect in pseudohypoparathyroidism is the isolated lack of sensitivity of the tubule to parathormone, while the other target organ - the bone - responds normally. The use of this test in diagnosis is discussed. 1 Figure, 1 Table, 4 Western, 5 Czech references.

TITLE: Investigation of the Mossbauer effect on Fe ⁵⁷ nuclei in nickel ferrite-chromite with a compensation point / Report, All-Union Conference on the Physics of Ferro- and Antiferromagnetism held 2-7 July 1965 in Sverdlovsk/ III	
SOURCE: AM SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 6, 1966, 949-956	
TOPIC TAGS: ferrite, Mossbauer effect, Mossbauer spectrum, spontaneous magnetization, magnetic effect, iron	
ABSTRACT: In view of the paucity of studies of the Mossbauer effect in ferrites, the present investigation was undertaken with a view to determining the temperature dependence of the Mossbauer spectra characterizing the absorption of 14.4 keV gamma rays by Fe ⁵⁷ nuclei in a ferrite with a compensation point. The investigated material was nickel ferrite-chromite: NiFe _{2-x} Cr _x O ₄ with x equal to 1.0 and 0.9; both substances have the inverse spinel structure. Both the Curie point and the compensation point of the two compositions lie above room temperature. The two specimens were synthesized by the so-called "dry" procedure of the corresponding oxides (high purity grade). All the measurements were carried out with a stationary absorber. A series of curves

in one figure gives the Mossbauer spectra of the Fe^{57} nuclei in the NiFeCrO_4 lattice at different temperatures. Also presented in graphic form are the results of studies of the temperature dependences of the spontaneous magnetization and the effective field at the Fe^{57} nuclei and of the magnetocaloric effect in the studied ferrite. Another figure shows the temperature dependence of the isomer shift. Detail graphs give the temperature variations of the spontaneous magnetization and the effective field at the iron nuclei in the proximity of the Curie point for both the investigated compositions. The character of the phase transition connoted by the data is discussed in general terms; the data are inadequate to identify the exact mechanism involved. In conclusion, the authors are grateful to I.K.Kikoin for support and his interest in the work and to Yu.M.Kagan for useful discussions. Thanks are also expressed to A.N.Goryaga for advice on preparation of the ferrites, and to P.K.Pronin, Ye.Ye.Kislyakov, and N.N.Kuznetsov for assistance in designing and adjusting the setups.

"Significance of the sex steroids in the pathogenesis of comedones (Russian text) VESTN. VENER. DERM. 1955, 2 (22-27)
Tables 4

Forty-nine patients with different forms of comedones were investigated; the blood serum, the urine and the skin sebum were analysed for the presence of sex steroids. The skin sebum displayed the presence of 17-ketosteroids, 3-hydro-steroids and oestrogens. The female patients showed an increase in the content of 17-ketosteroids in the urine and skin sebum, and often in the blood serum also; the amount of the oestrogens in the urine was decreased. The male patients more often showed a decrease in the content of 17-ketosteroids in urine and an increase in the skin sebum. The treatment of the patients with sex hormones (folliculin and progesterone for women and diethylboestrol for men) gave good results. If there were symptoms of hyperthyroidism, 6-methylthiouracil was added to the treatment. The author emphasizes the connection between the functional state of the sex glands and the cropping out of the comedones. In his opinion the follicular apparatus of the skin has excretory functions regarding the sex steroids. Bibliography - 20 titles.

Title : Treating Theileriosis-Affected Cattle with Amino-Quinacrine
in Combinations of Microelements and Vitamin B₁₂.
Orig Pub : Veterinariya, 1958, No. 3, 30-41.

Abstract : Amino-quinacrine was used in combinations of a 10 percent sodium bromide solution and a 1 percent water solution of novocain. During the initial stages of the disease, amino-quinacrine was intravenously injected in 0.003 g/kg. doses in a 1 percent solution 1 - 2 times. During the intervals between amino-quinacrine injections or 24 hours later, sodium bromide solution was injected 1 - 2 times in the same manner. Such treatment beneficially influenced the

Nbs Jour : Ref Zhur - Biol., No 22, 1958, No 101554

course of the disease; 15-30 percent of the treated animals succumbed, however, on the 20th - 29th day of the illness with distinctly marked anemia symptoms. When the above mentioned treatment methods were supplemented by the use of vitamins B₁₂ with cobalt chloride and copper sulfate, or of cobalt chloride and copper sulfate alone without the vitamin, 23 out of 24 sick animals recovered. When microelements and vitamin B₁₂ were used in combination with morphine plasmin and pyroplasmin, 12 out of 16 animals treated in this manner recovered. If treatment was unduly delayed, there were almost no cases of recovery. -- A. D. Musin.

"pediatriya" No 4, pp 21-24

This method of treating cases of poliomyelitis was started in the USSR in 1937, interrupted by World War II and resumed at the present time with favorable results. Though not widely publicized, according to the authors, this method is gaining attention of the medical world. In relating case histories, the

221935

article summarizes that the best results from X-ray treatment are attained when roentgenotherapy is used at the early stages of the disease.

243.

Abstract: In 31 of 41 cases of red polycythemia, the erythrocyte count and Hb level returned to normal after a course of total rentgenotherapy (TR) with doses of 150-450r. In relapses, occurring in individual cases within 2-5 years, a second course of TR was again productive of cure. TR is highly effective in cases where local irradiation of the bone marrow and spleen is unsafe. This therapy was less effective in chronic myeloid and lymphoid leu-

internally of radioactive phosphorus (in a 1-2 μ Curie dose) had a two-phase effect, namely, an initial intensification of the electric activity of the brain, followed by a depression of such activity. One-and-a-half to 3 months after the treatment was terminated some degree of a normalization in the electric activity was observed, which coincided with the advent of a remission, with the improvement of the blood's supply to the brain, as well as with the general improvement of the state of health.

"Nitrogen-Protein Composition of the Blood of Polycythemia Patients Who Have Been Treated With Radioactive Phosphorus," by I. V. Zaretskaya, Ye. D. Dubovyy, and D. A. Tsuverkalov, Chair of Biochemistry (head, Prof. D. A. Tsuverkalov) and Chair of Roentgenology and Radiology (head, Prof. Ye. D. Dubovyy), Odessa Medical Institute, Vrachebnoye Delo, No 10, Oct 56, pp 1015-1017

Nine patients (30-67 years old, with a history of polycythemia from 3 months to 17 years) were subjected to therapy by radioactive phosphorus given perorally in the form of Na_2HPO_4 in 10% glucose solution. The nitrogen-protein composition of blood serum was studied just before, immediately after, and 2-3 months after therapy by radiophosphorus. It was found that in the majority of patients total nitrogen and residual nitrogen were significantly increased immediately after radiophosphorus treatment and also 2-3 months later, and that these changes occur much earlier than changes in erythrocyte count and hemoglobin content.

"Experience of Using Leukocyte Suspension in Preventing Roentgenological Leukopenia," by Prof Ye. D. Dubovyy; Ye. L. Shvartzman, Candidate of Medical Sciences, G. A. Foygel' and R. S. Romanyuk, Chair of Roentgenology and Radiology (head, Prof Ye. D. Dubovyy*), Odessa Medical Institute imeni N. I. Pirogov (director, Prof I. Ya. Deyneka), and Odesskaya Oblast Station for Blood Transfusion (head, R. S. Romanyuk), Vestnik Rentgenologii i Radiologii, Vol 31, No 2, Mar/Apr 56, pp 25-28

This article discusses the special importance of administering leukocyte suspension in treating patients under X-ray therapy for malignant neoplasms. The leukocyte suspension was prepared from preserved blood by drawing off the plasma and then removing the whitish layer of leukocytes. At first leukocyte suspension was administered intravenously in 10-20 ml quantities, but later intramuscular injections also proved beneficial.

Thirty-seven patients were treated with 1-10 such transfusions. Preliminary positive results indicate the advisability of additional research for the use of leukocyte suspension in preventing roentgenological leukopenia

6706. X-RAY THERAPY OF ACUTE POSTOPERATIVE ANASTOMOSITIS
(Russian text) - Duboviy E. D. and Pekerman N. M. - KHIRURGIYA
1959, 3 (44-48)

Anastomositis is one of the cases of obstruction of anastomosis following stomach resection. X-ray examination was conducted in all patients before commencing the treatment of the operated stomach. The area of the stomach stump, anastomosis and the efferent loop were irradiated in connection with acute post-operative anastomositis (the size of the field being 10 x 15 cm. or 10 x 20 cm.). Voltage - 180 kv., current - 10 ma., filter - 0.3 mm. of copper and 1 mm. of aluminum. The single dose ranged from 50 to 60 r., depending on the degree of abdominal distension and the thickness of the subcutaneous fatty cellular tissue. The patients were irradiated 2-3 times, with an interval of 1-2 days. Nausea, vomiting and pain decreased in 1-3 days after the first irradiation and evacuation of the contrast medium from the stomach improved. After 2-3 irradiations all manifestations disappeared. Stomach evacuation normalized in 2-4 weeks. X-ray therapy proved to be effective in acute post-operative anastomositis. (IX, 14*)

Silicon steel and the concentration of iron, nickel and cobalt by silicon. M. Robowicz. *Przeglad Techn.* 67, 569-58, 1000 A, 1107 R, 1107 214(1957) 70-71. The diffusion of Si into Fe (0.07% C), Ni and Co was investigated. Si (99.9% Si), ferrosilicon (79.5% Si), and a mist of Si and NH₄Cl (1:1) were used as reacting material. The diffusion was carried out in air, in N and in a vacuum for periods of 4 hrs., at temps. from 900° to 1200°. The best results were obtained with the mist of Si and NH₄Cl in a vacuum. Ferrosilicon is less active. The Si powder penetrated only with much difficulty. The great activity of the mist of Si and NH₄Cl can be explained by assuming the participation of a gaseous phase in the reaction. Based on these results, some suggestions are made regarding the solidification diagrams of the Fe-Si, Ni-Si and Co-Si alloys. A limited solid soln. and a eutectic between their solid solutions and the intermetallic compounds, probably M₂Si or M₃Si, are present in all 3 cases. The hardness of the reacted layers is commented. The characteristic properties of high-strength deformed bars have been studied by the methods of the metallographic analysis of the material of the specimens and the methods of mechanical testing. The results of the analysis of the stages in the coarsening of materials and the stages in the heat treatment of the specimens are analyzed, and the dependence of the mechanical tests are analyzed, while more precise directions for the improvement of strength properties of steel under working conditions, as well as the dependence of the quality of high-strength deformed bars on the technological properties of the iron, the structure and the fineness of the iron powder.
